

# Solar Light Instructions

## How the Solar Light works

During the day, the solar panel converts solar power into the rechargeable battery. The light turns on automatically at dusk using the stored energy. How long the light lasts depends on its location, weather conditions, seasonal lighting availability and whether or not the battery is fully charged.

## Choosing the right location

An outdoor location with direct sunshine where the solar panel can receive at least 6 hours of sunshine each day is ideal. Shady locations will influence the battery charge and may shorten the working time of the light at night. The solar light should not be placed near electrical lighting, such as street lights, which may cause the light to turn off, as there is a sensor inside to detect brightness and control the light's functions. The solar light is ideal for nighttime illumination of the garden, lawn, patio, walkways or wherever light is needed. You can also charge the light outdoors and then use it indoors.

## Precautions

- Please note that the light is designed to work once it is dark.
- If there are strong light sources nearby, the Solar Light might be very dim or not function at all.
- Although the manufacturer has charged the battery, the electrical levels will have dropped when you receive it.
- Please charge the battery for a full day to optimize performance.
- The surface of the solar light must be kept clean for the battery to charge efficiently.

## How to use the Solar Light

Remove the insulating strip and place the lamp in a sunny location.

If the light does not turn on automatically after a 6-hour charge, please check the following:

- Check the battery to ensure that it is properly connected to the terminals.
- Make sure the Solar Light is placed in a sunny location and that the solar panels are facing the sun.

## Replacing the battery

If the light stops working after it has been used for a long time (approx. 18 months), the battery may need to be replaced. Open the cover of the battery to replace it with a new rechargeable battery. The lifespan of the LED lamp is over 100,000 hours, so you should never need to change it. Do not throw away old batteries - they must be disposed of properly.

Before initial use, the Solar Light needs to be in placed in direct sunlight for 6-8 hours to be fully charged.
